

Case Study

Hydraulic Equipment Test Facility		
Client	Eaton Hydraulics	
Location	Leamington Spa	
The Problem Eaton Hydraulics required a new test facility within their factory to test their equipment over 24 hour periods without causing noise disturbance to adjacent workers within the production area.		
The Solution A dedicated acoustic enclosure was designed and installed by AGS Noise Control Limited. The enclosure includes an attenuated ventilation system to provide cooling air to the plant. In addition, due to the plant being run overnight and being unattended, an automatic fire suppression system was also installed. AGS also provided the electrical installation including new power suppliers for the test equipment, new data connections and internal lighting.		Products Used Industrial Acoustic Panels Double Leaf Hinged Doors Attenuators Vision Panels Fire Suppression System Electrical Works
The Result The completed facility achieved the required external when the test rigs were in operation.		
Cost approx £75,000
